## Abstract

11

12 (???) is an experiment to examine the temporal and spatial aspects of memory through the  
13 use of virtual simulations. Specifically, in the following experiment,, to examine whether  
14 there is a relationship between mental simulations and the ability to navigate the fastest  
15 route.

Mental simulation of routes during navigation involves adaptive temporal compression

## Methods

### Participants

Twenty-eight participants were used with two participants being excluded for responding with mean reaction times of less than 1 second and failure to complete the simulation phase due to sickness.

### Material

### Procedure

Participants were navigated through a virtual city. First they were shown landmarks, ask to locate them, and then find the shortest path to the landmarks.

### Data analysis

We used R (Version 3.5.2; ???) for all our analyses.

## Results

### Power Analysis

## Discussion

The analysis failed to replicate the results of (???). This is believed to be a result of trouble identifying the conditions (groups slow, medium, and fast movement groups) from

<sup>35</sup> the dataset.
